

1 **Amendment to the Claims**

2 **In the Claims:**

3 Please cancel Claim 2, and amend Claims 1, 3, 4, and 5 as follows:

4 1. (Currently Amended) A device comprising:

5 a collection surface for supporting a spot of immobilized airborne particles, wherein
6 the collection surface is a regenerative surface; and

7 at least one detector capable of sensing a biological signature in the spot.

8 2. (Currently Cancelled)

9 3. (Currently Amended) [[A]] The device according to ~~claim 2~~ claim 1, wherein the detector
10 generates electrical signals, ~~and~~ further comprising a receiver coupled to the detector for receiving the
11 electrical signals.

12 4. (Currently Amended) The device according to ~~claim 2~~ claim 1, further comprising an
13 inertial impactor for immobilizing the spot of airborne particles on the regenerative collection
14 surface.

15 5. (Currently Amended) The device according to ~~claim 2~~ claim 1, wherein the detector is
16 selected from the group consisting of a fluorescence detector, a Raman spectrometer, a Fourier
17 transform infrared spectrometer, and a MALDI mass spectrometer.

18 6. (Original) The device according to claim 5 wherein the detector is a fluorescence detector
19 capable of emitting excitatory radiation of wavelengths operative to excite biomolecules.

20 7. (Original) The device according to claim 1 wherein the biological signature is selected
21 from the group consisting of autofluorescence, Raman spectrum, infrared absorption spectrum, and
22 mass spectrum.

23 8. (Original) A device comprising:

24 a regenerative collection surface for supporting a spot of immobilized airborne
25 particles;

26 an excitation light source for emitting excitatory radiation towards the spot, the
27 excitatory radiation having a wavelength operative to excite biomolecules to produce fluorescence;
28 and

29 a fluorescence photosensor for measuring fluorescence radiation emitted from the
30 spot.

1 9. (Original) The device according to claim 8 wherein the excitatory radiation is
2 substantially ultraviolet, and the fluorescence radiation is substantially visible.

3 10. (Original) The device according to claim 8 wherein the excitation light source is a LED.

4 11. (Original) The device according to claim 10 wherein the wavelength operative to excite
5 biomolecules is within a 340-370 nm range.

6 12. (Original) The device according to claim 8 wherein the wavelength operative to excite
7 biomolecules is of approximately 266 nm.

8 13. (Original) The device according to claim 8 wherein the wavelength operative to excite
9 biomolecules is of approximately 400 nm.

10 14. (Original) The device according to claim 8 wherein the fluorescence photosensor is a
11 photodiode.

12 15. (Original) The device according to claim 8 further comprising a dichroic mirror that
13 substantially reflects excitatory radiation and is substantially transparent to fluorescence radiation, the
14 dichroic mirror being positioned to reflect the excitatory radiation towards the spot.

15 16. (Original) The device according to claim 15 further comprising at least one of an
16 excitation filter positioned between the excitation light source and the dichroic mirror, and an
17 emission filter positioned between the dichroic mirror and the fluorescence photosensor.

18 17. (Original) A device comprising:
19 a detector capable of sensing a biological signature in a spot of airborne particles
20 immobilized on a collection surface, the detector producing signals indicative of the biological
21 signature; and

22 a processor coupled to the detector to receive the signals, the processor being capable
23 to process the signals to establish a concentration of biological particles in the spot, and the processor
24 being capable to output an alarm signal when it establishes that the concentration of biological
25 particles in the spot exceeds a predetermined value.

26 18. (Original) The device according to claim 17 wherein the collection surface is a
27 regenerative collection surface.

28 19. (Original) The device according to claim 17 wherein the detector is a fluorescence
29 detector.

30 20. (Original) The device according to claim 17 wherein the processor is a Neuron Chip®.

- 1 21. (Original) A method of detecting airborne biological particles, the method comprising:
2 depositing airborne particles on a regenerative collection surface to form a spot;
3 measuring a biological signature present in the spot;
4 determining a concentration of airborne biological particles from the measurement;
5 and
6 regenerating the collection surface.
7 22. (Original) The method according to claim 21 wherein depositing is by inertial impaction.
8 23. (Original) The method according to claim 21 wherein the biological signature is
9 autofluorescence.
10 24. (Original) The method according to claim 21 wherein the biological signature is selected
11 from the group consisting of autofluorescence, Raman spectrum, infrared absorption spectrum, and
12 mass spectrum.
13 25. (Original) A method of continuous monitoring of airborne biological particles, the
14 method comprising a plurality of cycles, each cycle comprising:
15 depositing airborne particles on a regenerative collection surface to form a spot;
16 measuring autofluorescence of biomolecules in the spot;
17 determining a present value of a concentration of airborne biological particles from the
18 measurement; and
19 regenerating the collection surface.
20 26. (Original) The method according to claim 25 further comprising:
21 calculating an average value and a standard deviation from a defined number of prior
22 present values obtained in the defined number of preceding cycles;
23 comparing the present value to the average value; and
24 outputting an alarm signal if the present value exceeds the average value plus a preset
25 factor multiplied by the standard deviation.
26 27. (Original) The method according to claim 26 wherein the defined number is eight.
27 28. (Original) The method according to claim 26 wherein the preset factor is between about
28 3 and 5.
